

FasalDoc — Business Model Canvas

A single-page view of how FasalDoc creates, delivers, and captures value. Pairs with the Financial Projections workbook and Founding Blueprint for a complete submission packet.

Key Partners	University of Agriculture Faisalabad (UAF) and PARC for local data & validation • Agricultural extension offices for distribution • LLM providers (Gemini, Groq, OpenRouter) • Supabase & Vercel for infrastructure • Agri-input companies (e.g. Engro, FFC) for B2B2C • Government agriculture departments & ZTBL for institutional reach
Key Activities	AI model development, fine-tuning, and fallback engineering • Remedy database curation and agronomist/vet validation • Mobile/web (PWA) product development • Farmer community building and pilot testing • Partnership and government relations development
Key Resources	Multi-provider AI integration with offline RAG fallback • Curated, expert-validated remedy database • Agronomist/vet advisory network • Founding team's technical expertise (AI/ML, full-stack, DevOps) • Growing local crop/livestock image dataset (the core moat)
Value Propositions	Instant AI diagnosis from a single phone photo • Locally relevant organic and chemical remedies with real product names and PKR cost • Fully offline-capable — works without reliable connectivity • Urdu-first accessibility for a market underserved by English-only tools • One hub for diagnosis, weather risk, market prices, government schemes, and tele-vet access
Customer Relationships	Self-service app with an always-available AI chat assistant • Community-driven disease/pest alert reports • Tele-vet booking for cases needing a human expert • Planned farmer ambassador/referral program for organic, trust-based growth
Channels	Installable Progressive Web App (Android-first) • Agricultural extension worker networks • Partnerships with agri-input dealers and government scheme programs • Word-of-mouth within farming communities • University and research institution networks
Customer Segments	Smallholder crop farmers (primary) • Livestock owners — cattle, buffalo, goats, poultry • Agricultural extension workers and field officers (distribution partner + user) • Agri-input dealers and local veterinary providers (secondary) • Government and NGO agricultural programs (B2B/institutional)
Cost Structure	Cloud hosting and LLM API usage (scales with users) • Local data collection and agronomist/vet validation • Team compensation as the company scales • Marketing and partnership development • Ongoing customer support and community moderation
Revenue Streams	Freemium subscriptions (basic diagnosis free; advanced features paid) • B2B2C licensing to agri-input companies • Marketplace commission on remedy purchases (Phase

3) • Government/NGO program contracts • Aggregated, anonymized regional disease-trend data insights (longer-term)

Reading This Canvas

Year 1 is deliberately revenue-light. The Financial Projections model shows \$0 formal revenue in Year 1 by design — the priority is proving the diagnosis loop works, collecting local data, and building trust with a pilot group of real farmers. Monetization (subscriptions, B2B2C deals) ramps starting Year 2, once there's a validated user base to build commercial conversations around.

The real defensibility lives in two blocks: Key Resources and Key Activities. Anyone can call an LLM API. What's hard to replicate is the curated, agronomist-validated remedy database built on locally collected Pakistani crop and livestock data — that's the moat, and it's why the roadmap treats data collection as a first-class workstream, not an afterthought.

Customer Segments deliberately separates farmers (the user) from institutions (the payer) starting Phase 2. This is a common and healthy pattern for agri-tech serving low-ability-to-pay end users — the free tier drives adoption and data, while B2B2C and government partnerships carry the actual revenue load.
